# IEEE 802.11 WiFi

IEEE 802.11 standard	Year	Max data rate	Range	Frequency
802.11b	1999	11 Mbps	30m	2.4 Ghz
802.11a	1999	54 Mbps	30m	5 Ghz
802.11g	2003	54 Mbps	30m	2.4 Ghz
802.11n (WiFi 4)				2.4, 5 Ghz
802.11ac (WiFi 5)				5 Ghz
802.11ax (WiFi 6)	2020 (exp.)	14 Gbps		2.4, 5 Ghz
802.11af	2014	35 – 560 Mbps	1 Km	unused TV bands (54-790 MHz)
802.11ah	2017	347Mbps	1 Km	900 Mhz

- all use CSMA/CA for multiple access, and have base-station and ad-hoc network versions

## 802.11 LAN architecture

- ❖ wireless host communicates with base station
- base station = access point (AP)
- Service Set (BSS) (aka in infrastructure contains:

- wireless hosts
- access point (AP): base station
- ad hoc mode: hosts only

- › 802.11b: 2.4GHz-2.485GHz spectrum divided into 11 channels at different frequencies
  - AP admin chooses frequency for AP
  - interference possible, channel can be same as that chosen by neighboring AP!
- › host: must *associate* with
  - scans channels, listening
  - selects AP to associate with
  - may perform authentication
  - will typically run DHCP to get IP address in AP's subnet

Assignment Project Exam Help

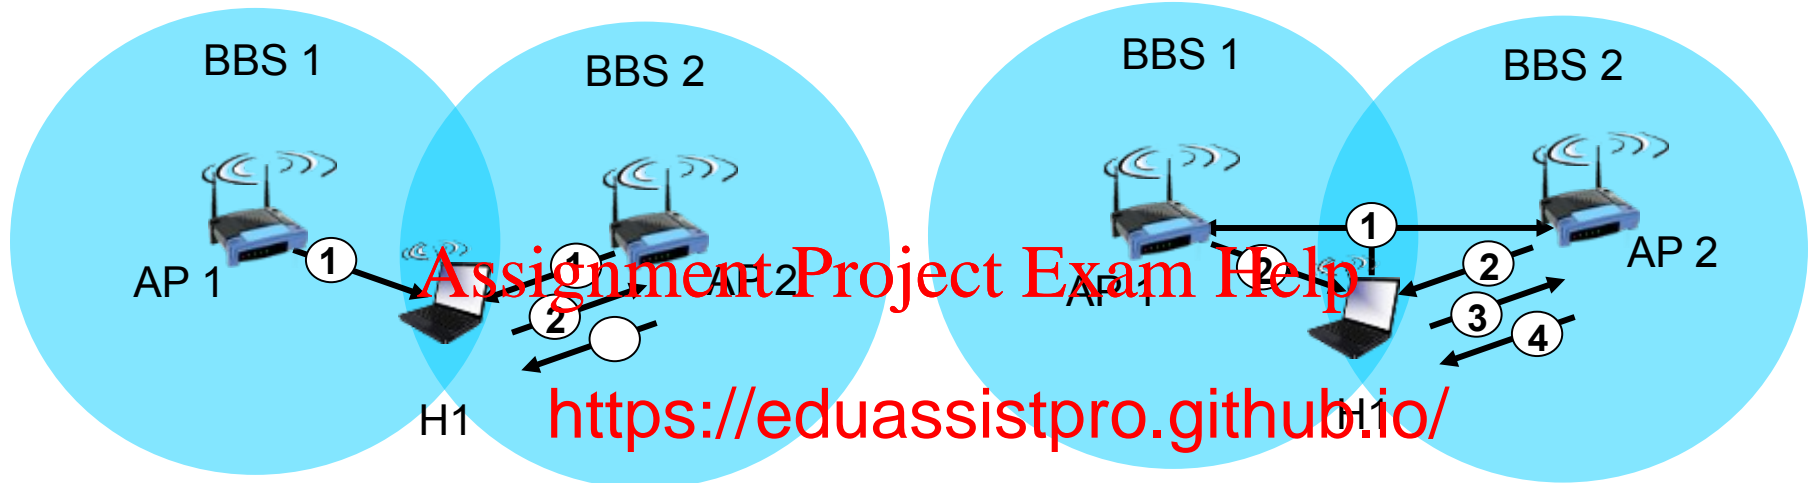

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

name (SSID) and MAC address

## 802.11: passive/active scanning

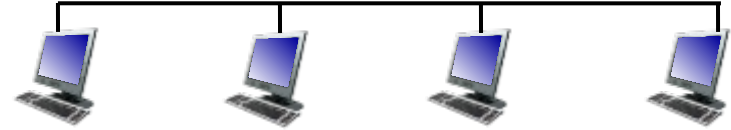

### passive scanning:

- (1) beacon frames sent from APs
- (2) association Request frame sent: H1 to selected AP
- (3) association Response frame sent from selected AP to H1

### Add WeChat: edu\_assist:pro

- (1) est frame broadcast from H1
- (2) Probe Response frames sent from APs
- (3) Association Request frame sent: H1 to selected AP
- (4) Association Response frame sent from selected AP to H1

› collisions *can* occur:

propagation delay means

two nodes may not hear  
each other's transm

Assignment Project Exam Help

<https://eduassistpro.github.io/>

› collision: frame transmission  
time wasted

Add WeChat edu\_assist\_pro

## CSMA/CD:

- collisions *detected* within short time
- colliding transmissions aborted, reducing channel wastage

### > collision detection:

- wired LANs: measure transmitted, received signals
- Can transmit and sense at the same time
- wireless LANs: received signal strength by local transmission strength
- CSMA-CD cannot be used in wireless LAN

Assignment Project Exam Help

spatial layout of nodes

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

## IEEE 802.11: multiple access

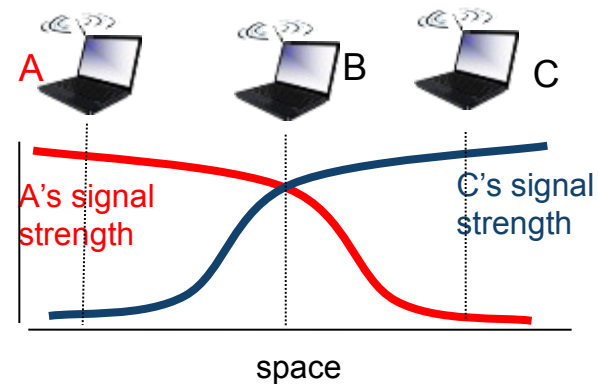

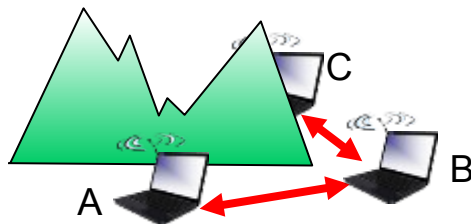

### > 802.11: no collision detection!

- difficult to receive (sense collisions) when transmitting due to weak received signals (fading)
- can not sense all collisions in any case: hidden terminal, fading
- goal: *avoid collisions*:

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# IEEE 802.11 MAC Protocol: CSMA/CA

## 802.11 sender

1 if sense channel idle for **DIFS** ( Distributed inter-frame space ) then

transmit entire frame (no CD)

2 if sense channel busy then

start random backoff timer

timer counts down while channel idle

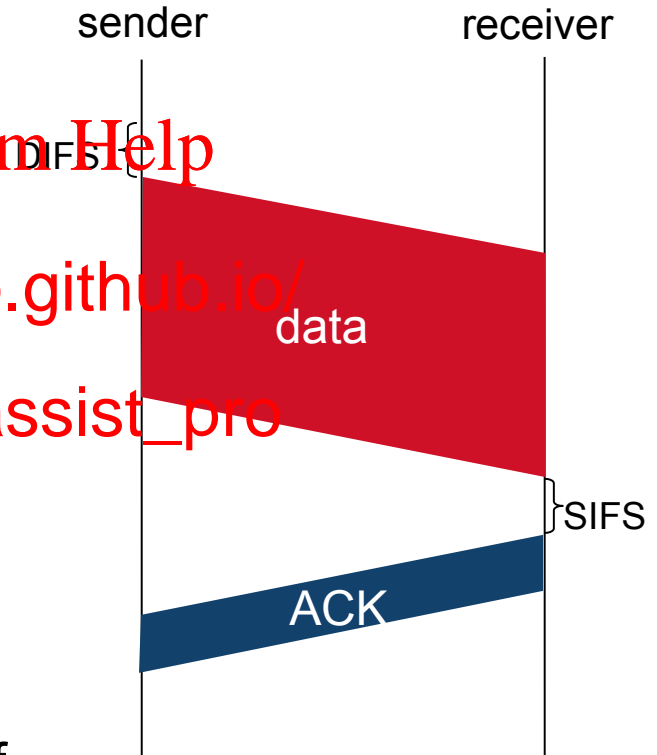

transmit when timer expires

## 802.11 receiver

- if frame received OK

return ACK after **SIFS** (Shorter inter-frame spacing)

Sender : if no ACK, increase random backoff interval, repeat 2

*idea:* allow sender to “reserve” channel rather than random access of data frames: avoid collisions of long data frames

› sender first transmits *small* request-to-send (RTS) packets to BS using CSMA

- RTSs may still collide

<https://eduassistpro.github.io/>

› BS broadcasts clear-to-send CTS in response to RTS

› CTS heard by all nodes

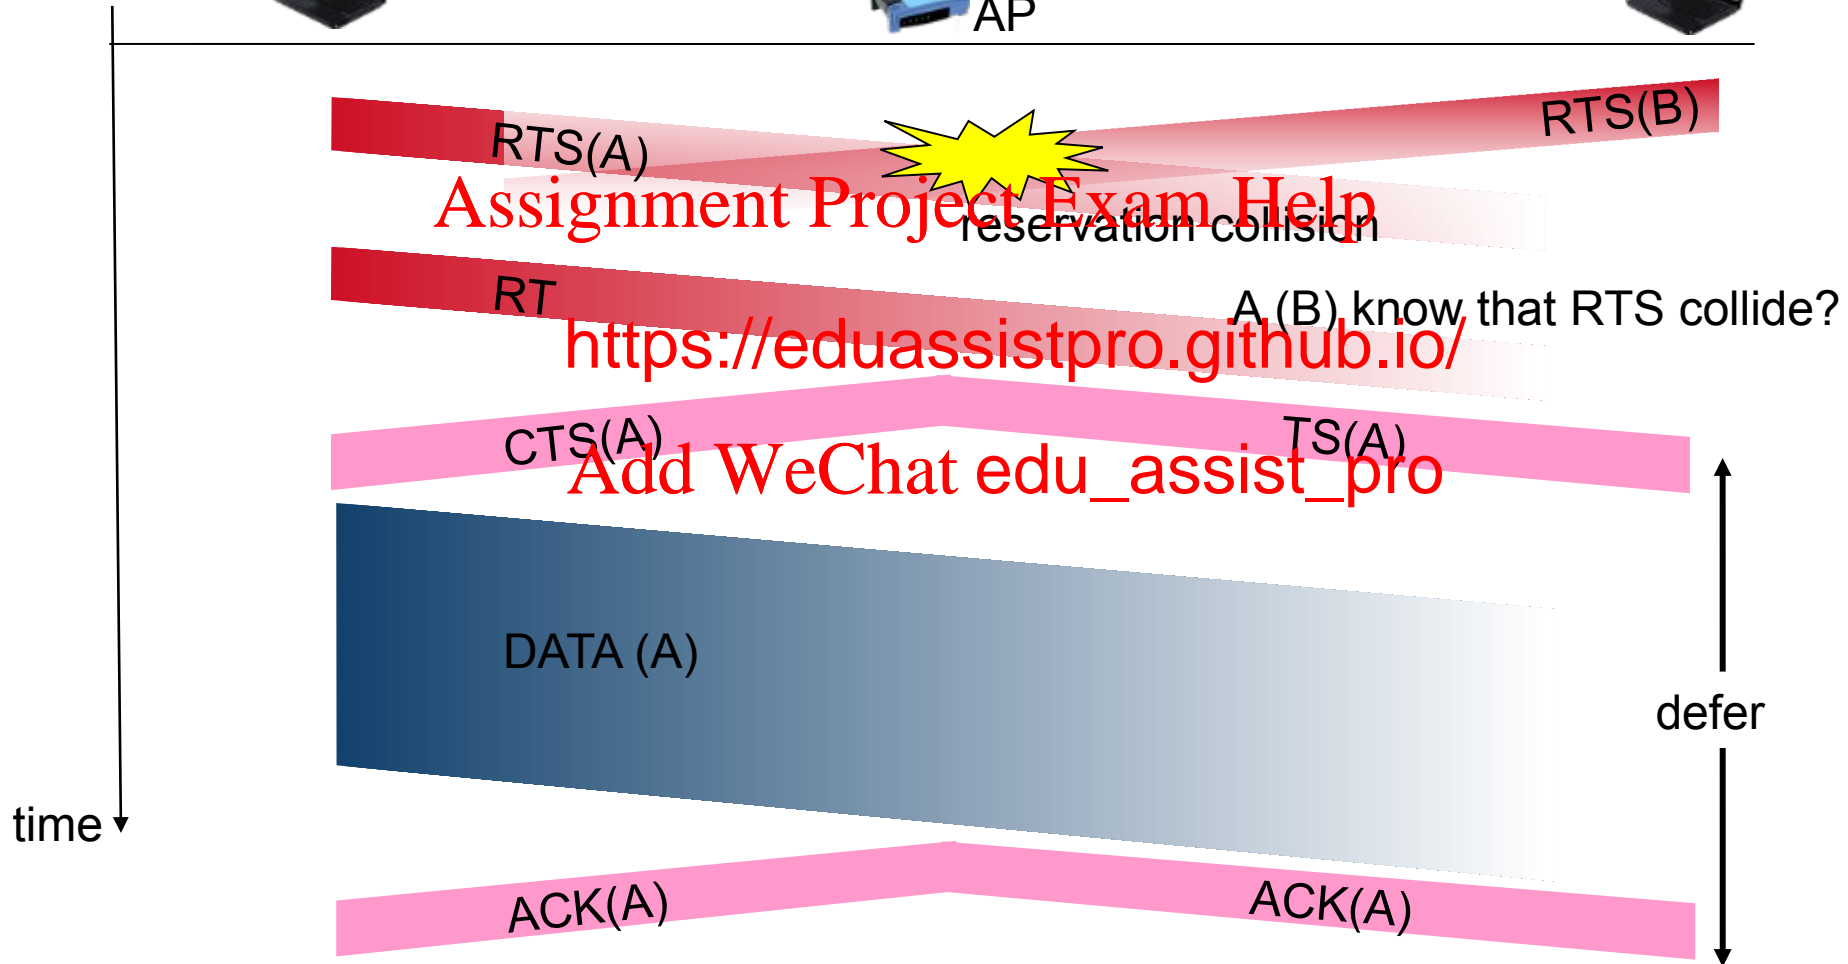

- sender transmits data frame

- other stations defer transmissions

*avoid data frame collisions completely  
using small reservation packets!*

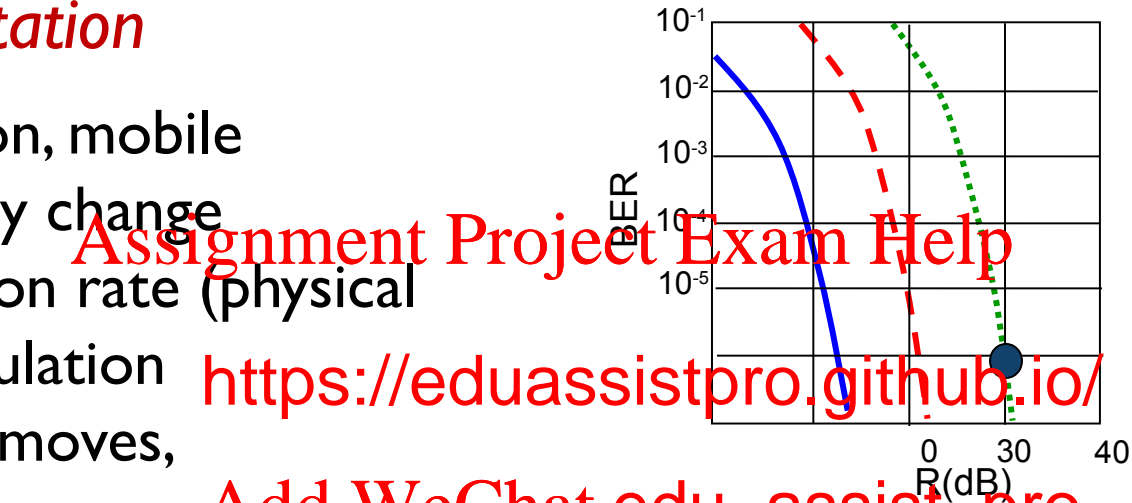

# Collision Avoidance: RTS-CTS exchange

## Rate adaptation

- › base station, mobile dynamically change transmission rate (physical layer modulation as mobile moves, varies

- ..... QAM256 (8 Mbps)
- - - QAM16 (4 Mbps)
- BPSK (1 Mbps)
- operating point

1. SNR decreases, BER increase as node moves away from base station
2. When BER becomes too high, switch to lower transmission rate but with lower BER

Add WeChat edu\_assist\_pro

*permanent address:*  
address in home  
network, *can always* be  
used to reach mobile  
e.g., 128.119.40.186

## Mobility: more vocabulary

*permanent address:* remains constant (e.g., 128.119.40.186)

*Foreign (visited) network:* network in which mobile currently resides (e.g., 79.129.13/24)

*care-of-address:* address in visited network.

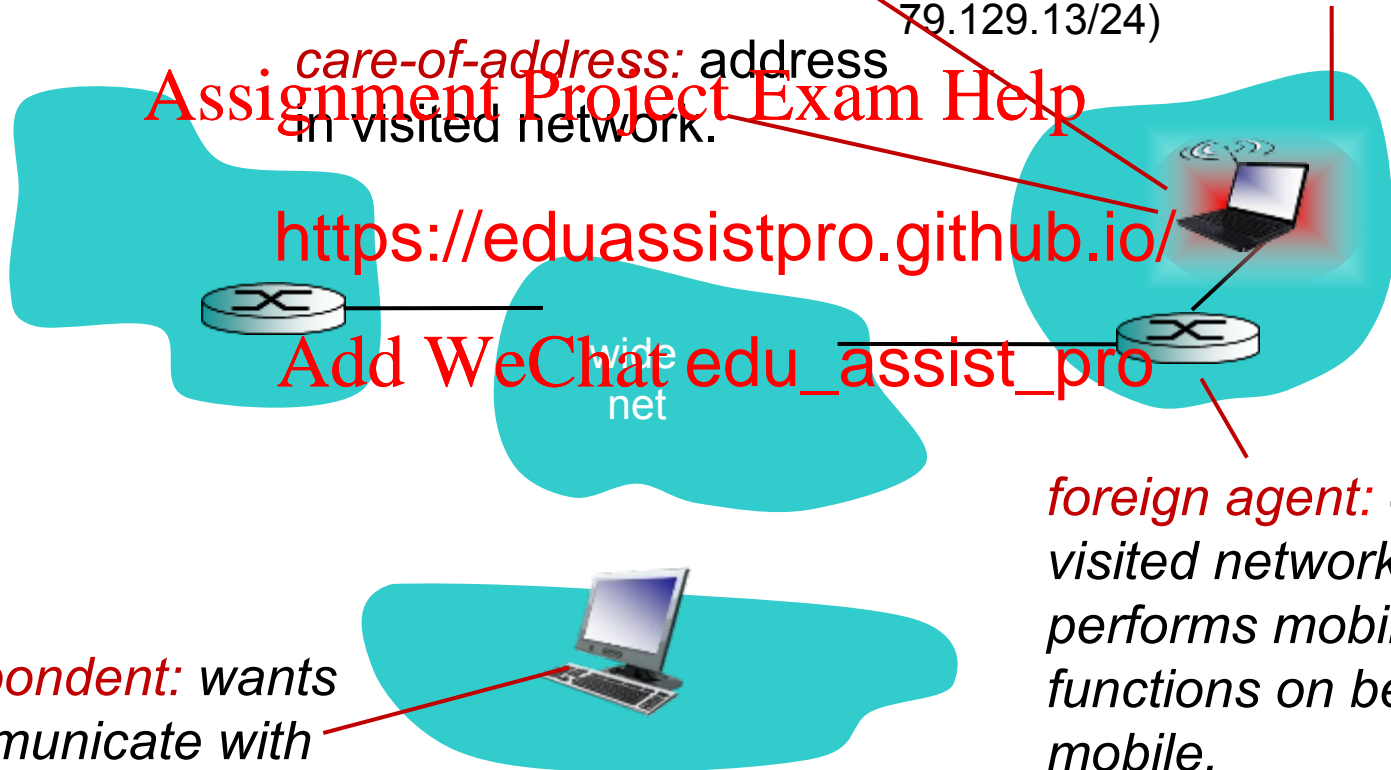

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

*correspondent:* wants to communicate with mobile

*foreign agent:* entity in visited network that performs mobility functions on behalf of mobile.

# How do you contact a mobile friend:

Consider friend frequently changing addresses, how do you find her?

Assignment Project Exam Help

- › search all phone books <https://eduassistpro.github.io/>
- › call her parents?
- › expect her to let you know where he/she is?

Add WeChat edu\_assist\_pro

I wonder where Alice moved to?

- › *let routing handle it*: routers advertise permanent address of mobile-nodes-in-residence via usual routing table exchange.
  - routing tables indicate where each mobile located
  - no changes to end-s
- › *let end-systems handle* <https://eduassistpro.github.io/>
  - *indirect routing*: communication from correspondent mobile goes through home agent, then forwarded to remote
  - *direct routing*: correspondent gets foreign address of mobile, sends directly to mobile

## Mobility: approaches

- › *let routing handle it*: route to advertise permanent address of mobile-nodes-in-residence. not scalable routing table exchange.
  - routing tables indicate where mobile nodes are located
  - no changes to end-systems
- › *let end-systems handle it*: <https://eduassistpro.github.io/>
  - *indirect routing*: communication from correspondent mobile goes through home agent, then forwarded to remote
  - *direct routing*: correspondent gets foreign address of mobile, sends directly to mobile

# Mobility: registration

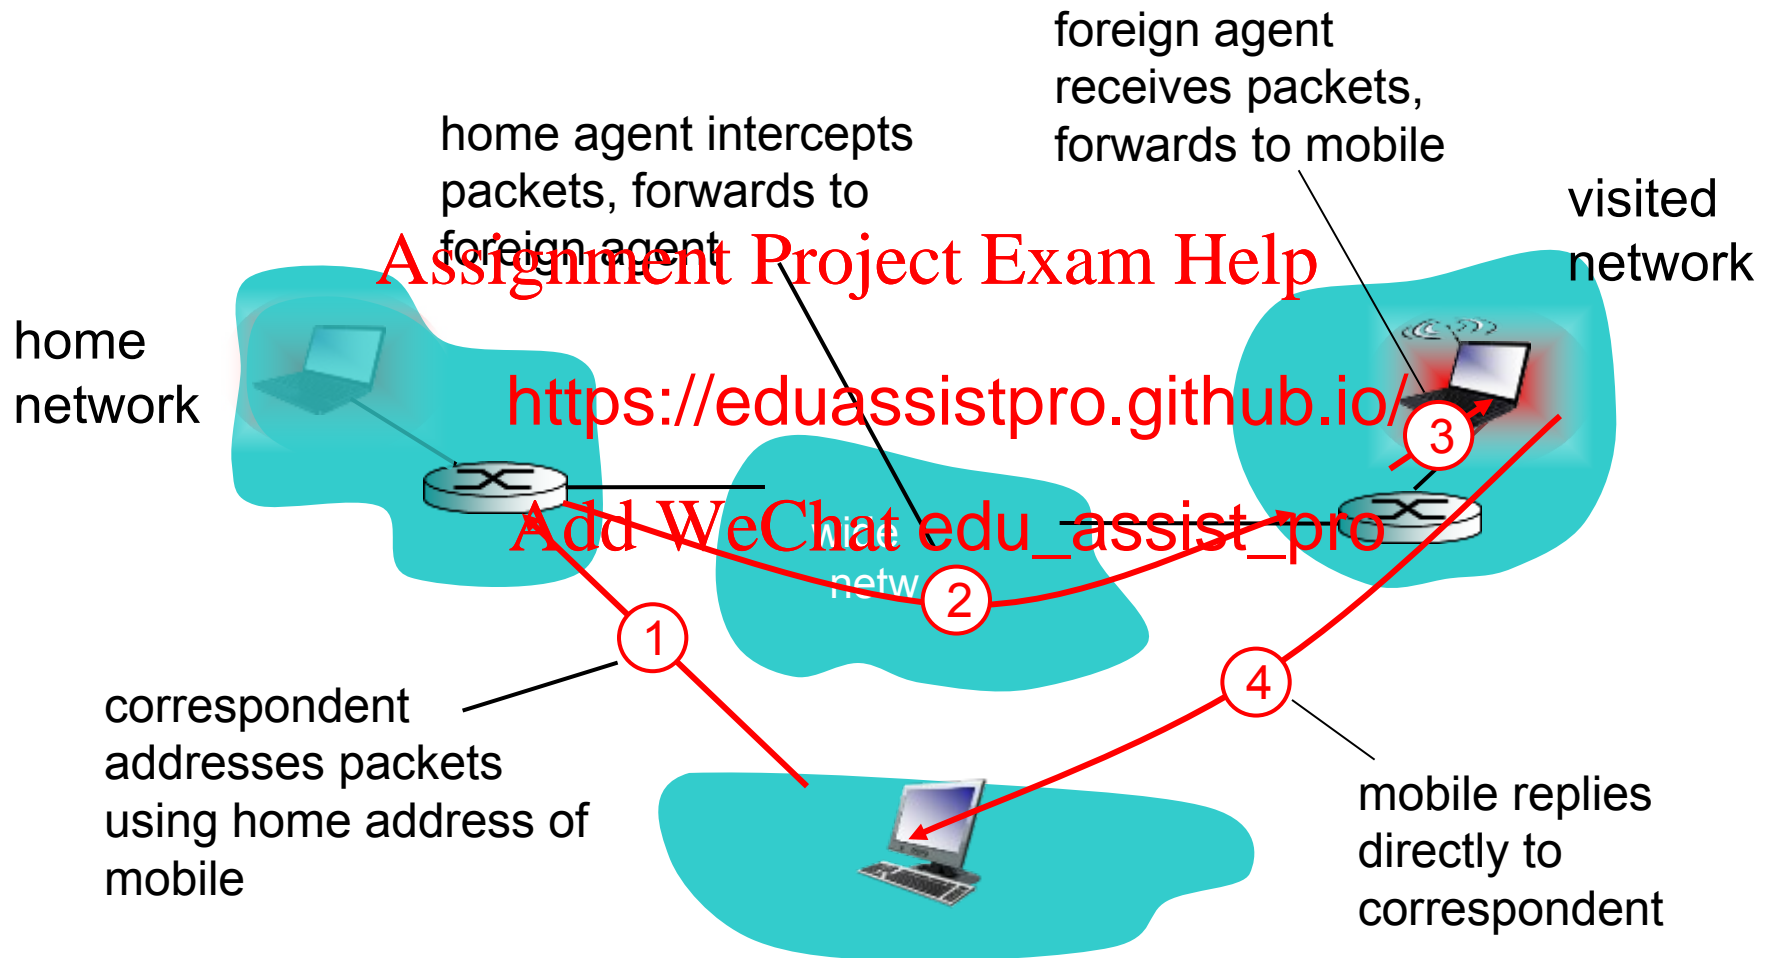

end result:

- › foreign agent knows about mobile
- › home agent knows location of mobile

# Mobility via indirect routing

# Indirect Routing: comments

› mobile uses two addresses:

- **permanent address:** used by correspondent (hence mobile location is *transparent* to correspondent)
- **care-of-address:** used by home agent to forward datagrams to mobile

› **triangle routing:** corr

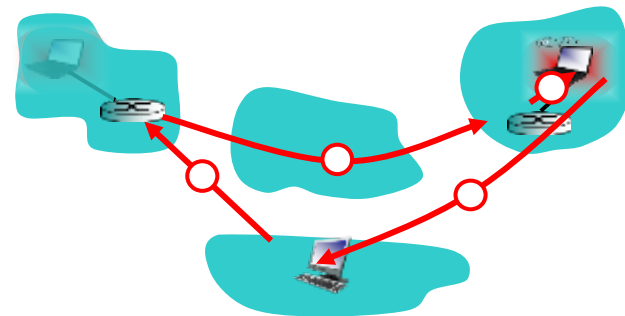

- inefficient when corr

mobile

<https://eduassistpro.github.io/>

network

Add WeChat edu\_assist\_pro

## Indirect routing: moving between networks

- › suppose mobile user moves to another network
  - registers with new foreign agent
  - new foreign agent registers with home agent
  - home agent updates mobile
  - packets continue to old care-of-address (but with new care-of-address)
- › changing foreign networks transparent: *on going connections can be maintained!*

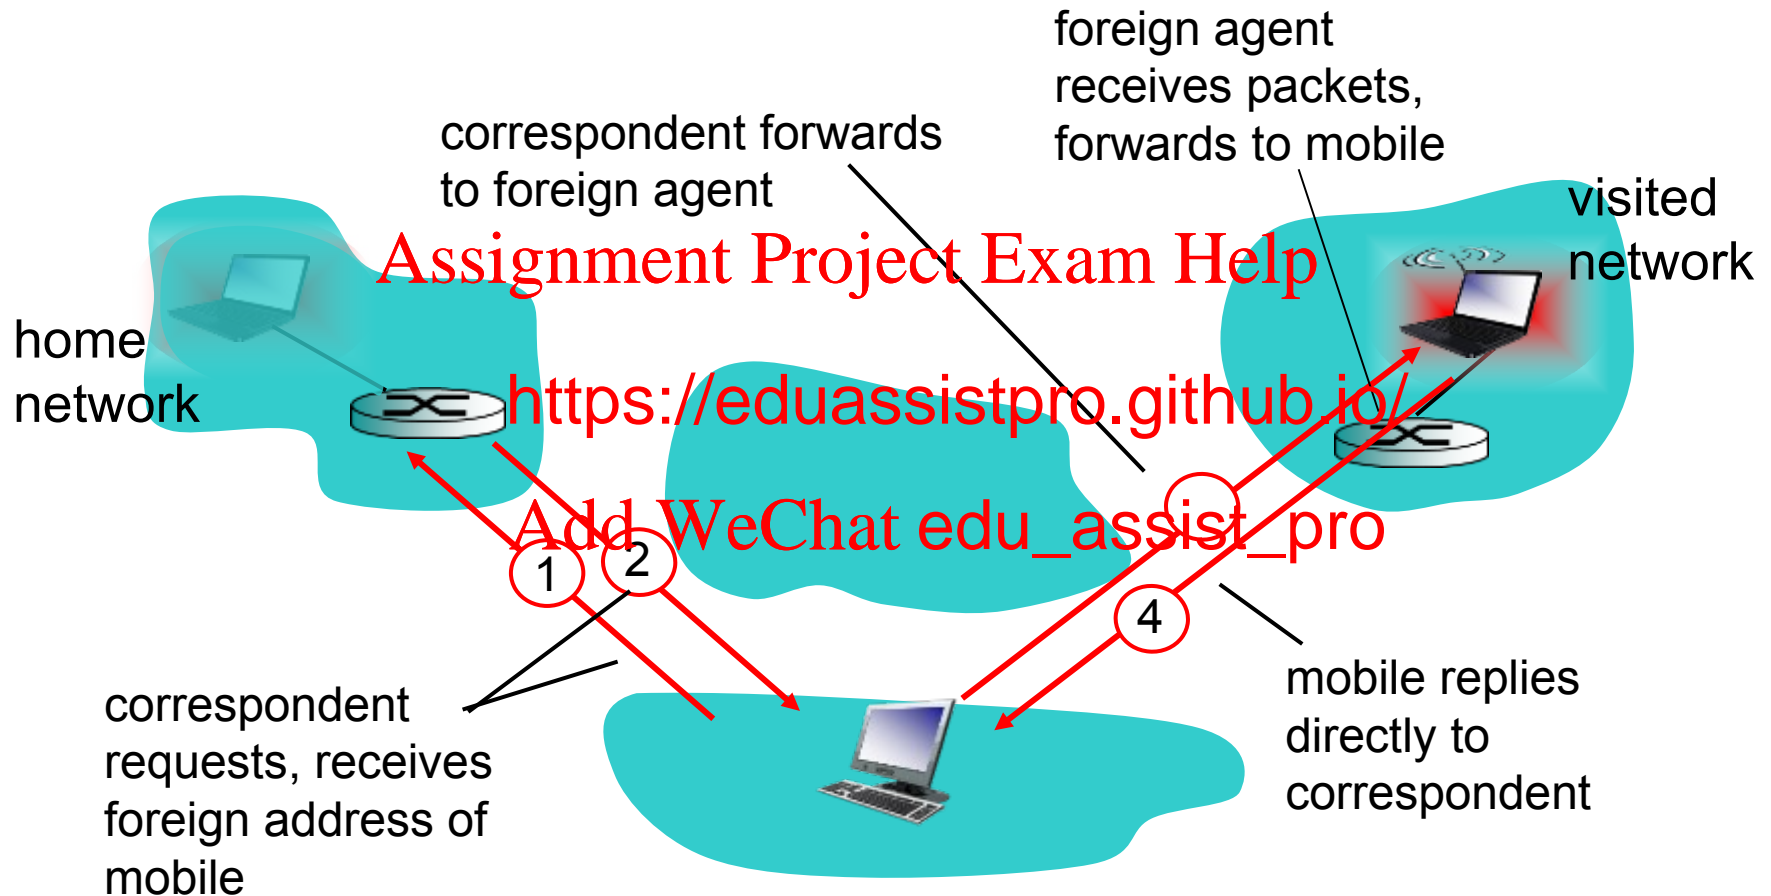

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Mobility via direct routing

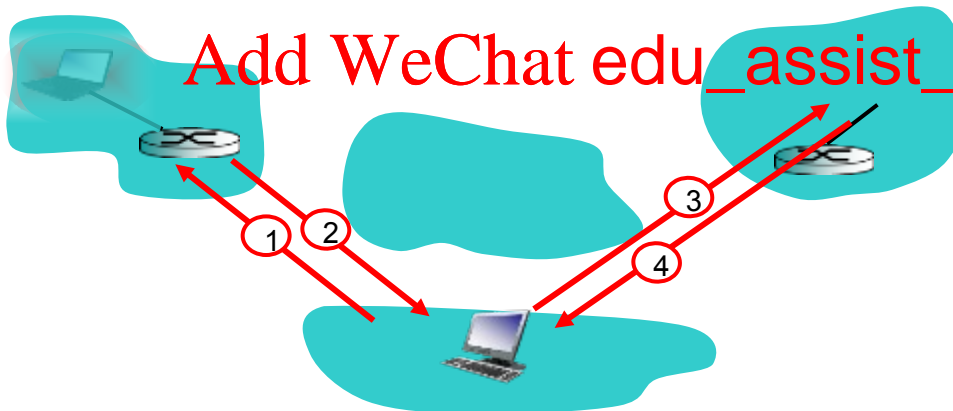

# Mobility via direct routing: comments

- › overcome triangle routing problem
- › *non-transparent to correspondent*: correspondent must get care-of-address from home agent
  - what if mobile changes visited network?

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

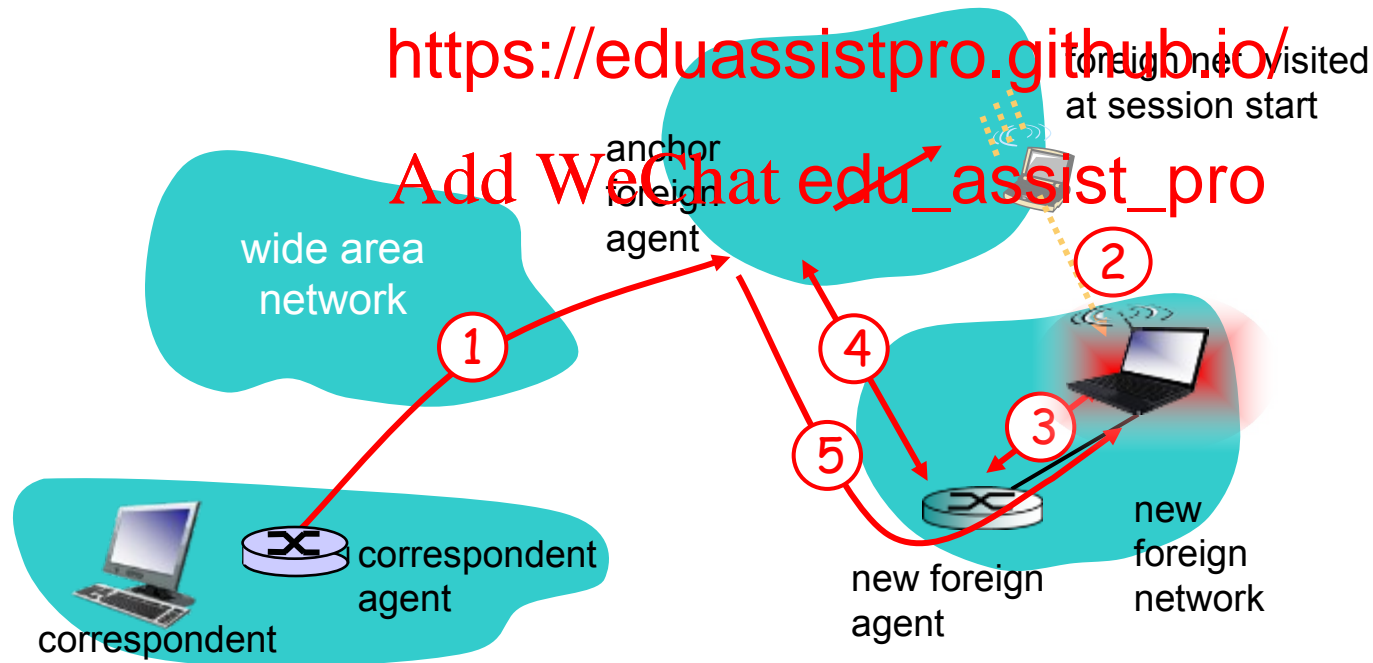

# Accommodating mobility with direct routing

- › anchor foreign agent: FA in first visited network
- › data always routed first to anchor FA
- › when mobile moves: new FA arranges to have data forwarded from old FA (chaining)

# Wireless, mobility: impact on higher layer protocols

› logically, impact *should* be minimal ...

- best effort service model remains unchanged
- TCP and UDP can (and do) run over wireless, mobile

› ... but performance-wise:

- packet loss/delay due to (retransmissions), and delays for link-layer
- TCP interprets loss as congestion, will decrease window unnecessarily
- delay impairments for real-time traffic
